

## Task 2 - README

Author: Sawan Bhardwaj

### APIs Used:

- CoinGecko (free, no key needed) - fetches top 5 coins by market cap
- CoinGecko detail endpoint - enriches #1 coin with deeper price data

### Why these APIs:

No authentication required, reliable, free tier is generous.

Perfect for a real-time financial digest use case.

### What the transformation does:

Code node strips raw CoinGecko response down to only 5 fields per coin (name, symbol, price, 24h change, market cap) and identifies the #1 ranked coin for the enrichment call.

### Conditional logic:

IF node checks if #1 coin 24h change > 3%.

True - sends urgent alert to Telegram.

False - sends calm daily digest.

### Error handling:

Separate Error Trigger node catches any workflow failure and immediately sends a warning message to the same Telegram channel. Workflow never fails silently.
